

## The Texture of Clay Tile with the Strength of Steel

Innovative methods and bespoke production techniques are elevating coated steel to new levels of formability, strength and versatility.

The **COLORPLUS**® Textured range has a natural textured finish similar to that of a clay tile. The slightly granular appearance is substantially different from a conventional flat finish, making it particularly attractive on tile-profiled sheeting. Alternative applications include interior cladding.

The textured paint finish is applied onto a **ZincAL**® substrate for optimal durability. In addition to its aesthetic appeal, **COLORPLUS**® Textured offers a number of benefits:

- The enhanced paint formulation retains colour integrity and reduces dust retention.
- Lightweight tile-profiled sheets allow for faster and more cost-effective installation than heavy clay tiles.
- The inherent strength of the steel also reduces the impact of hail and high winds, further reducing maintenance costs over the service life of the roof.

### **COLORPLUS**® Textured is available in a variety of vibrant colours:

Adding colour not only offers aesthetic appeal, but also increases solar reflection. Tests have proven that based on the colour spectrum, light colours offer a higher reflectance compared to dark colours.
